Hello Robin.

Look at "C:\Documents and Settings\%AccountName%\Application
Data\Subversion\servers" file on your client system.
Edit them (instructions contained in the file).

For example, look at my servers file (bypassing unknown root authority for
repositories with tsvn and subversion sources):

[groups]
collab = *.collab.net

[collab]
ssl-ignore-unknown-ca = true
ssl-ignore-host-mismatch = true

Subject: [https certificate issuer] Error validating server certificate: Unknown
issuer. Accept? (y/N):

Hello,

I am really happy to have just started to use subversion/tortoisesvn.
Everything works great except one problem:

we have a https server running webdav dav_svn modules. The
Certificate of the server is signed by our own certification authority.
When I now try to check out something with Tortoise SVN I receive
following error message:
Error validating server certificate: Unknown issuer. Accept? (y/N):

I feel this comes from openssl or neon code (didn't find it in your
code). Is there any way I can register this certificate (maybe just
in the way I do it under linux .subversion/servers?

Our system settings are:
Client: Win XP Sp1
TortoiseSVN Version 0.17

Server: SuSE Linux 8.2
subversion server module Version 0.27 (rpm)
Apache2 Version: 2.0.47

A great feature for the future would also be to let the user specify
its username himself (maybe with the current username as a default).
I have the problem that I have to use differing windows usernames
between
the web server and the client.

You guys are doing great work! Thanks a lot!

Cheers
Robin
